- Displacement, velocity, and acceleration
- Equations of motion
- Projectile motion
- Relative motion

Newton's Laws of Motion

Newton's laws form the foundation of classical mechanics. Students explore the relationship between forces and motion, including:

- Inertia and the first law of motion
- Force and acceleration (second law)
- Action-reaction pairs (third law)

Work, Energy, and Power

This section examines the concepts of work and energy, crucial for understanding how systems behave. Topics include:

- Kinetic and potential energy
- Work-energy theorem
- Conservation of energy

Systems of Particles and Linear Momentum

Students learn about the motion of multiple bodies and the conservation of momentum. Important topics include:

- Center of mass
- Impulse and momentum
- Collisions (elastic and inelastic)

Rotational Motion

Rotational dynamics is another critical area, where students study:

- Angular velocity and acceleration
- Torque and moment of inertia
- Conservation of angular momentum

Each of these topics builds on the previous ones, creating a comprehensive understanding of mechanics that is vital for success in advanced physics courses.

Effective Tutoring Strategies
