Newton's Laws of Motion

Newton's laws are a set of three physical laws that describe the relationship between the motion of an

object and the forces acting upon it. These laws lay the groundwork for classical mechanics and are essential for understanding a wide range of physical phenomena.

- **First Law (Inertia):** An object at rest stays at rest, and an object in motion stays in motion unless acted upon by a net external force.
- **Second Law ($F=ma$):** The acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass.
- **Third Law (Action-Reaction):** For every action, there is an equal and opposite reaction.

Conservation Laws

Conservation laws are also pivotal in can j physics, including the conservation of energy, momentum, and charge. These laws state that certain properties of isolated systems remain constant over time, providing a powerful tool for analyzing physical situations.
