

WHAT IS APPARENT WEIGHT IN PHYSICS

THE ARTICLE SHOULD BE ABOUT "WHAT IS APPARENT WEIGHT IN PHYSICS" AND THE KEYWORD DENSITY FOR "WHAT IS APPARENT WEIGHT IN PHYSICS" SHOULD BE AROUND 1-2%.

UNDERSTANDING APPARENT WEIGHT IN PHYSICS

WHAT IS APPARENT WEIGHT IN PHYSICS REFERS TO THE FORCE THAT AN OBJECT EXPERIENCES AS IF IT WERE SUPPORTED BY A SURFACE OR A FLUID, RATHER THAN ITS TRUE, ABSOLUTE WEIGHT. WHILE GRAVITY CONSTANTLY PULLS AN OBJECT DOWNWARDS, CREATING ITS ACTUAL WEIGHT, APPARENT WEIGHT CAN DIFFER SIGNIFICANTLY WHEN THE OBJECT IS IN MOTION OR EXPERIENCING OTHER FORCES. THIS CONCEPT IS CRUCIAL FOR UNDERSTANDING PHENOMENA RANGING FROM THE FEELING OF LIGHTNESS IN AN ELEVATOR TO THE BEHAVIOR OF SUBMARINES AND ASTRONAUTS IN SPACE. WE'LL DELVE INTO THE FUNDAMENTAL PRINCIPLES GOVERNING APPARENT WEIGHT, EXPLORE THE FORCES THAT INFLUENCE IT, AND EXAMINE REAL-WORLD APPLICATIONS THAT MAKE THIS PHYSICS CONCEPT SO COMPELLING. BY UNDERSTANDING APPARENT WEIGHT, WE GAIN A DEEPER APPRECIATION FOR THE INTERPLAY OF FORCES IN OUR EVERYDAY WORLD AND BEYOND.

WHAT IS APPARENT WEIGHT?

APPARENT WEIGHT IS ESSENTIALLY THE "FELT" WEIGHT OF AN OBJECT. IT'S THE MAGNITUDE OF THE UPWARD FORCE EXERTED ON AN OBJECT BY ITS SUPPORT, WHICH IS OFTEN A SURFACE OR A FLUID. IMAGINE STANDING ON A BATHROOM SCALE; THE NUMBER YOU SEE IS YOUR APPARENT WEIGHT. THIS APPARENT WEIGHT IS A DIRECT RESULT OF THE NORMAL FORCE ACTING ON YOU. WHEN AN OBJECT IS AT REST ON A HORIZONTAL SURFACE AND NO OTHER VERTICAL FORCES ARE PRESENT, ITS APPARENT WEIGHT IS EQUAL TO ITS ACTUAL WEIGHT. HOWEVER, AS SOON AS EXTERNAL FORCES BEGIN TO ALTER THE INTERACTION BETWEEN THE OBJECT AND ITS SUPPORT, THE APPARENT WEIGHT WILL DEVIATE FROM THE ACTUAL WEIGHT. IT'S THIS DEVIATION THAT MAKES THE CONCEPT OF APPARENT WEIGHT SO FASCINATING AND IMPORTANT IN PHYSICS.

THE CONCEPT HINGES ON NEWTON'S THIRD LAW OF MOTION, WHICH STATES THAT FOR EVERY ACTION, THERE IS AN EQUAL AND OPPOSITE REACTION. THE SUPPORT EXERTS AN UPWARD FORCE (THE NORMAL FORCE) ON THE OBJECT, AND THE OBJECT, IN TURN, EXERTS A DOWNWARD FORCE ON THE SUPPORT. APPARENT WEIGHT IS A MEASURE OF THIS NORMAL FORCE. WHEN THIS NORMAL FORCE CHANGES, OUR PERCEPTION OF THE OBJECT'S WEIGHT CHANGES, EVEN THOUGH THE GRAVITATIONAL FORCE PULLING ON IT REMAINS CONSTANT. UNDERSTANDING THIS FUNDAMENTAL DISTINCTION IS KEY TO UNLOCKING THE NUANCES OF APPARENT WEIGHT.

THE ROLE OF ACTUAL WEIGHT

ACTUAL WEIGHT, OFTEN REFERRED TO AS GRAVITATIONAL WEIGHT, IS THE FORCE OF GRAVITY ACTING ON AN OBJECT'S MASS. IT IS CALCULATED BY MULTIPLYING THE OBJECT'S MASS (m) BY THE ACCELERATION DUE TO GRAVITY (g), SO WEIGHT (W) = $m \cdot g$. THIS FORCE IS ALWAYS DIRECTED DOWNWARDS TOWARDS THE CENTER OF THE EARTH (OR ANY CELESTIAL BODY THE OBJECT IS NEAR). THE MASS OF AN OBJECT IS AN INTRINSIC PROPERTY, MEANING IT DOESN'T CHANGE REGARDLESS OF LOCATION OR THE PRESENCE OF OTHER FORCES. THEREFORE, THE ACTUAL WEIGHT OF AN OBJECT IS CONSTANT IN A SPECIFIC GRAVITATIONAL FIELD.

HOWEVER, WHAT WE PERCEIVE AS WEIGHT IS NOT ALWAYS THIS CONSTANT GRAVITATIONAL PULL. IT'S THE FORCE WE FEEL PUSHING BACK AGAINST US, RESISTING OUR DOWNWARD ACCELERATION OR SUPPORTING OUR MASS. THIS DISTINCTION IS CRITICAL. WHEN YOU'RE IN FREEFALL, FOR INSTANCE, YOUR ACTUAL WEIGHT IS STILL ACTING ON YOU, BUT YOUR APPARENT WEIGHT IS ZERO BECAUSE THERE IS NO SUPPORTING SURFACE TO EXERT A NORMAL FORCE. THE CONCEPT OF ACTUAL WEIGHT PROVIDES THE BASELINE GRAVITATIONAL FORCE, AGAINST WHICH WE MEASURE THE VARIATIONS IN APPARENT WEIGHT.

FORCES AFFECTING APPARENT WEIGHT

SEVERAL FORCES CAN INFLUENCE THE APPARENT WEIGHT OF AN OBJECT. THE MOST COMMON AND SIGNIFICANT IS ACCELERATION. WHEN AN OBJECT IS ACCELERATING UPWARDS, THE SUPPORT NEEDS TO PROVIDE A GREATER NORMAL FORCE TO ACHIEVE THAT ACCELERATION, MAKING THE OBJECT FEEL HEAVIER. CONVERSELY, IF AN OBJECT IS ACCELERATING DOWNWARDS, THE SUPPORT NEEDS TO PROVIDE LESS NORMAL FORCE, RESULTING IN A FEELING OF BEING LIGHTER. THIS IS DIRECTLY LINKED TO NEWTON'S SECOND LAW OF MOTION ($F = ma$). THE NET FORCE ACTING ON AN OBJECT IS EQUAL TO ITS MASS TIMES ITS ACCELERATION. IN THE CONTEXT OF APPARENT WEIGHT, THE NET VERTICAL FORCE IS THE DIFFERENCE BETWEEN THE NORMAL FORCE AND THE GRAVITATIONAL FORCE.

ANOTHER CRITICAL FACTOR IS BUOYANCY. WHEN AN OBJECT IS SUBMERGED IN A FLUID (LIQUID OR GAS), THE FLUID EXERTS AN UPWARD FORCE CALLED THE BUOYANT FORCE. THIS BUOYANT FORCE EFFECTIVELY REDUCES THE DOWNWARD FORCE EXPERIENCED BY THE OBJECT, THUS DECREASING ITS APPARENT WEIGHT. THIS IS WHY OBJECTS FEEL LIGHTER IN WATER THAN THEY DO IN AIR. THE GREATER THE DENSITY OF THE FLUID AND THE VOLUME OF THE SUBMERGED OBJECT, THE GREATER THE BUOYANT FORCE AND THE LOWER THE APPARENT WEIGHT.

OTHER FORCES, SUCH AS AIR RESISTANCE, CAN ALSO PLAY A ROLE, THOUGH OFTEN A LESS SIGNIFICANT ONE IN EVERYDAY SCENARIOS COMPARED TO ACCELERATION AND BUOYANCY. AIR RESISTANCE ACTS OPPOSITE TO THE DIRECTION OF MOTION, AND IN CERTAIN SITUATIONS, IT CAN SLIGHTLY ALTER THE FORCES EXERTED ON A SUPPORT, THEREBY INFLUENCING APPARENT WEIGHT.

APPARENT WEIGHT IN DIFFERENT SCENARIOS

LET'S EXPLORE SOME COMMON SCENARIOS TO SOLIDIFY OUR UNDERSTANDING OF APPARENT WEIGHT.

ELEVATORS AND APPARENT WEIGHT

THE EXPERIENCE OF STANDING IN AN ELEVATOR IS A CLASSIC ILLUSTRATION OF HOW ACCELERATION AFFECTS APPARENT WEIGHT.

AT REST OR CONSTANT VELOCITY: WHEN AN ELEVATOR IS STATIONARY OR MOVING AT A CONSTANT SPEED, THE ACCELERATION IS ZERO. IN THIS CASE, THE NORMAL FORCE FROM THE ELEVATOR FLOOR EQUALS THE OBJECT'S ACTUAL WEIGHT, SO APPARENT WEIGHT EQUALS ACTUAL WEIGHT. YOU FEEL YOUR NORMAL WEIGHT.

ACCELERATING UPWARDS: WHEN THE ELEVATOR BEGINS TO MOVE UPWARDS, IT ACCELERATES. THE ELEVATOR FLOOR MUST EXERT AN ADDITIONAL UPWARD FORCE TO CAUSE THIS ACCELERATION. THIS RESULTS IN A NORMAL FORCE GREATER THAN THE OBJECT'S WEIGHT, MAKING YOU FEEL HEAVIER. YOUR APPARENT WEIGHT INCREASES.

DECELERATING UPWARDS (ACCELERATING DOWNWARDS): WHEN THE ELEVATOR SLOWS DOWN WHILE MOVING UPWARDS, IT IS ACCELERATING DOWNWARDS. THE NORMAL FORCE REQUIRED IS LESS THAN THE OBJECT'S WEIGHT, MAKING YOU FEEL LIGHTER. YOUR APPARENT WEIGHT DECREASES.

ACCELERATING DOWNWARDS: WHEN THE ELEVATOR BEGINS TO MOVE DOWNWARDS RAPIDLY, IT ACCELERATES DOWNWARDS. THE NORMAL FORCE EXERTED BY THE FLOOR IS LESS THAN THE OBJECT'S WEIGHT, MAKING YOU FEEL LIGHTER. YOUR APPARENT WEIGHT DECREASES.

DECELERATING DOWNWARDS (ACCELERATING UPWARDS): WHEN THE ELEVATOR SLOWS DOWN WHILE MOVING DOWNWARDS, IT IS ACCELERATING UPWARDS. THE NORMAL FORCE REQUIRED IS GREATER THAN THE OBJECT'S WEIGHT, MAKING YOU FEEL HEAVIER. YOUR APPARENT WEIGHT INCREASES.

FREEFALL: IN THE EXTREME CASE OF FREEFALL (E.G., IF THE ELEVATOR CABLES SNAP), THE ONLY SIGNIFICANT FORCE ACTING ON YOU IS GRAVITY. THERE IS NO SUPPORT FORCE FROM THE FLOOR, SO THE NORMAL FORCE IS ZERO. YOUR APPARENT WEIGHT BECOMES ZERO, LEADING TO THE SENSATION OF WEIGHTLESSNESS.

OBJECTS IN FLUIDS

THE CONCEPT OF APPARENT WEIGHT IS PARAMOUNT WHEN DEALING WITH OBJECTS IMMERSED IN FLUIDS.

SUBMERGED OBJECTS: AS MENTIONED, THE BUOYANT FORCE OF A FLUID OPPOSES GRAVITY. THE APPARENT WEIGHT OF A SUBMERGED OBJECT IS ITS ACTUAL WEIGHT MINUS THE BUOYANT FORCE. THIS IS WHY A LARGE SHIP, DESPITE HAVING IMMENSE ACTUAL WEIGHT, CAN FLOAT. THE BUOYANT FORCE EXERTED BY THE WATER IS EQUAL TO THE SHIP'S WEIGHT.

OBJECTS IN WATER: WHEN YOU STEP INTO A SWIMMING POOL, YOU IMMEDIATELY FEEL LIGHTER. THIS IS BECAUSE THE WATER IS SUPPORTING A PORTION OF YOUR WEIGHT THROUGH BUOYANCY. THE DEEPER YOU GO, THE MORE WATER SURROUNDS YOU, AND THE GREATER THE BUOYANT FORCE, THUS FURTHER REDUCING YOUR APPARENT WEIGHT.

SPACE AND APPARENT WEIGHT

ASTRONAUTS IN ORBIT EXPERIENCE WHAT IS COMMONLY REFERRED TO AS "WEIGHTLESSNESS." HOWEVER, THIS IS A MISUNDERSTANDING OF APPARENT WEIGHT.

ORBITING: IN ORBIT, ASTRONAUTS ARE CONSTANTLY FALLING TOWARDS THE EARTH DUE TO GRAVITY, BUT THEY ARE ALSO MOVING SIDEWAYS AT A VERY HIGH SPEED. THIS SIMULTANEOUS FALLING AND SIDEWAYS MOTION CAUSES THEM TO CONTINUOUSLY MISS THE EARTH, RESULTING IN A STATE OF FREEFALL. WHILE GRAVITY IS STILL ACTING ON THEM, THERE IS NO SUPPORTING SURFACE TO PROVIDE A NORMAL FORCE. THEREFORE, THEIR APPARENT WEIGHT IS ZERO, EVEN THOUGH THEIR ACTUAL WEIGHT (DUE TO EARTH'S GRAVITY) IS STILL SIGNIFICANT.

REAL-WORLD APPLICATIONS OF APPARENT WEIGHT

THE PRINCIPLES OF APPARENT WEIGHT HAVE NUMEROUS PRACTICAL APPLICATIONS ACROSS VARIOUS FIELDS.

AEROSPACE ENGINEERING: UNDERSTANDING HOW APPARENT WEIGHT CHANGES DURING ROCKET LAUNCHES AND RE-ENTRY IS CRITICAL FOR ASTRONAUT SAFETY AND SPACECRAFT DESIGN. SIMULATORS OFTEN USE G-FORCE MACHINES TO REPLICATE THESE CHANGING APPARENT WEIGHTS.

MARINE ENGINEERING: THE DESIGN OF SHIPS, SUBMARINES, AND FLOATING STRUCTURES RELIES HEAVILY ON THE PRINCIPLES OF BUOYANCY AND APPARENT WEIGHT. CALCULATING HOW MUCH CARGO A VESSEL CAN CARRY NECESSITATES UNDERSTANDING THE BUOYANT FORCES AT PLAY.

DIVING AND SUBMERSIBLE TECHNOLOGY: FOR DIVERS AND THE OPERATION OF SUBMERSIBLES, KNOWING HOW APPARENT WEIGHT CHANGES WITH DEPTH AND THE DENSITY OF THE SURROUNDING WATER IS VITAL FOR CONTROL AND NAVIGATION.

MEDICAL APPLICATIONS: IN SOME MEDICAL DIAGNOSTICS AND TREATMENTS, UNDERSTANDING THE FORCES AN OBJECT EXPERIENCES, INCLUDING APPARENT WEIGHT, CAN BE IMPORTANT. FOR INSTANCE, IN SIMULATING CONDITIONS OR DESIGNING SPECIALIZED EQUIPMENT.

EVERYDAY TECHNOLOGY: EVEN SEEMINGLY SIMPLE DEVICES LIKE CRANES RELY ON PRINCIPLES RELATED TO APPARENT WEIGHT, ENSURING THEY CAN LIFT AND MANEUVER HEAVY LOADS SAFELY BY MANAGING THE FORCES INVOLVED.

FACTORS INFLUENCING APPARENT WEIGHT

SEVERAL KEY FACTORS DIRECTLY INFLUENCE THE APPARENT WEIGHT OF AN OBJECT.

ACCELERATION: AS DISCUSSED EXTENSIVELY, ANY VERTICAL ACCELERATION OF THE SUPPORTING FRAME OR THE OBJECT ITSELF WILL ALTER THE NORMAL FORCE AND THUS THE APPARENT WEIGHT.

BUOYANCY: THE PRESENCE OF A FLUID MEDIUM AND THE OBJECT'S IMMERSION IN IT INTRODUCE A BUOYANT FORCE THAT COUNTERACTS GRAVITY, REDUCING APPARENT WEIGHT. THE DENSITY OF THE FLUID AND THE VOLUME OF THE SUBMERGED PORTION OF THE OBJECT ARE KEY DETERMINANTS OF THE BUOYANT FORCE.

GRAVITATIONAL FIELD STRENGTH: WHILE APPARENT WEIGHT CAN VARY DUE TO ACCELERATION AND BUOYANCY, THE UNDERLYING ACTUAL WEIGHT IS DETERMINED BY THE LOCAL GRAVITATIONAL FIELD. IF AN OBJECT IS MOVED TO A LOCATION WITH A DIFFERENT GRAVITATIONAL PULL, ITS ACTUAL WEIGHT CHANGES, AND CONSEQUENTLY, ITS BASELINE APPARENT WEIGHT IN EQUILIBRIUM ALSO CHANGES.

MASS OF THE OBJECT: THE MASS OF AN OBJECT DICTATES ITS ACTUAL WEIGHT. A MORE MASSIVE OBJECT WILL HAVE A GREATER ACTUAL WEIGHT, AND THEREFORE, ITS APPARENT WEIGHT IN EQUILIBRIUM CONDITIONS WILL ALSO BE HIGHER.

DISTINGUISHING APPARENT WEIGHT FROM ACTUAL WEIGHT

IT IS CRUCIAL TO REITERATE THE DISTINCTION BETWEEN APPARENT WEIGHT AND ACTUAL WEIGHT.

ACTUAL WEIGHT: THIS IS THE FORCE OF GRAVITY ON AN OBJECT'S MASS ($W = mg$). IT IS CONSTANT IN A GIVEN GRAVITATIONAL FIELD.

APPARENT WEIGHT: THIS IS THE MAGNITUDE OF THE NORMAL FORCE EXERTED BY A SUPPORT ON AN OBJECT. IT CAN VARY DEPENDING ON THE OBJECT'S ACCELERATION AND THE PRESENCE OF OTHER FORCES LIKE BUOYANCY.

THINK OF IT THIS WAY: YOUR ACTUAL WEIGHT IS WHAT GRAVITY IS DOING TO YOU. YOUR APPARENT WEIGHT IS HOW YOU FEEL THAT INTERACTION WITH YOUR SURROUNDINGS. WHEN YOU'RE ON A STABLE SURFACE AND NOT ACCELERATING, YOUR APPARENT WEIGHT FEELS JUST LIKE YOUR ACTUAL WEIGHT. BUT WHEN FORCES CHANGE, LIKE IN AN ELEVATOR OR UNDERWATER, WHAT YOU "FEEL" AS YOUR WEIGHT CAN BE VERY DIFFERENT. THIS UNDERSTANDING IS FUNDAMENTAL TO GRASPING MANY CONCEPTS IN PHYSICS AND ENGINEERING.

FREQUENTLY ASKED QUESTIONS ABOUT APPARENT WEIGHT IN PHYSICS

Q: WHAT IS THE PRIMARY DIFFERENCE BETWEEN APPARENT WEIGHT AND ACTUAL WEIGHT?

A: THE PRIMARY DIFFERENCE LIES IN WHAT THEY REPRESENT. ACTUAL WEIGHT IS THE FORCE OF GRAVITY ACTING ON AN OBJECT'S MASS ($W=mg$), AND IT IS CONSTANT IN A GIVEN GRAVITATIONAL FIELD. APPARENT WEIGHT, ON THE OTHER HAND, IS THE FORCE EXERTED BY A SUPPORT ON AN OBJECT, WHICH CAN CHANGE DUE TO FACTORS LIKE ACCELERATION OR BUOYANCY. IT'S THE "FELT" WEIGHT.

Q: HOW DOES BEING IN AN ELEVATOR AFFECT MY APPARENT WEIGHT?

A: WHEN AN ELEVATOR ACCELERATES UPWARDS, YOUR APPARENT WEIGHT INCREASES BECAUSE THE FLOOR NEEDS TO EXERT A GREATER UPWARD FORCE TO ACHIEVE THAT ACCELERATION. CONVERSELY, WHEN THE ELEVATOR ACCELERATES DOWNWARDS, YOUR APPARENT WEIGHT DECREASES AS THE FLOOR EXERTS LESS FORCE. IF THE ELEVATOR IS MOVING AT A CONSTANT SPEED OR IS STATIONARY, YOUR APPARENT WEIGHT EQUALS YOUR ACTUAL WEIGHT.

Q: CAN AN OBJECT HAVE ZERO APPARENT WEIGHT EVEN IF GRAVITY IS ACTING ON IT?

A: YES, ABSOLUTELY. THIS OCCURS IN SITUATIONS LIKE FREEFALL OR ORBITING IN SPACE. IN THESE SCENARIOS, THE OBJECT IS ACCELERATING DOWNWARDS DUE TO GRAVITY, BUT THERE IS NO SUPPORTING SURFACE TO PROVIDE A NORMAL FORCE. SINCE APPARENT WEIGHT IS THE MEASURE OF THIS NORMAL FORCE, IT BECOMES ZERO, LEADING TO THE SENSATION OF WEIGHTLESSNESS.

Q: WHAT ROLE DOES BUOYANCY PLAY IN DETERMINING APPARENT WEIGHT?

A: BUOYANCY IS THE UPWARD FORCE EXERTED BY A FLUID. WHEN AN OBJECT IS SUBMERGED IN A FLUID, THIS BUOYANT FORCE OPPOSES GRAVITY. THE APPARENT WEIGHT IS THEN THE OBJECT'S ACTUAL WEIGHT MINUS THE BUOYANT FORCE, EFFECTIVELY MAKING THE OBJECT FEEL LIGHTER.

Q: IS IT POSSIBLE FOR APPARENT WEIGHT TO BE GREATER THAN ACTUAL WEIGHT?

A: YES, IT IS. THIS HAPPENS WHEN AN OBJECT IS EXPERIENCING AN UPWARD ACCELERATION. FOR INSTANCE, WHEN AN ELEVATOR STARTS MOVING UPWARDS, THE FLOOR MUST PUSH HARDER ON YOU TO ACCELERATE YOU UPWARDS, MAKING YOUR APPARENT WEIGHT GREATER THAN YOUR ACTUAL GRAVITATIONAL WEIGHT.

Q: WHY DO ASTRONAUTS IN THE INTERNATIONAL SPACE STATION EXPERIENCE WEIGHTLESSNESS IF EARTH'S GRAVITY IS STILL SIGNIFICANT THERE?

A: ASTRONAUTS IN ORBIT ARE IN A STATE OF CONTINUOUS FREEFALL. THEY ARE FALLING TOWARDS EARTH DUE TO GRAVITY, BUT THEIR HIGH SIDEWAYS VELOCITY CAUSES THEM TO CONSTANTLY MISS IT. SINCE THERE IS NO SUPPORTING SURFACE TO EXERT A NORMAL FORCE, THEIR APPARENT WEIGHT IS ZERO, EVEN THOUGH THE GRAVITATIONAL FORCE IS STILL PRESENT.

Q: HOW IS APPARENT WEIGHT RELATED TO THE NORMAL FORCE?

A: APPARENT WEIGHT IS DIRECTLY MEASURED BY THE NORMAL FORCE. THE NORMAL FORCE IS THE PERPENDICULAR FORCE EXERTED BY A SURFACE ON AN OBJECT THAT IS IN CONTACT WITH IT. WHEN OTHER FORCES ARE NOT ACTING, THE NORMAL FORCE EQUALS THE OBJECT'S WEIGHT. HOWEVER, WHEN ACCELERATION OR BUOYANCY IS INVOLVED, THE NORMAL FORCE DEVIATES FROM THE ACTUAL WEIGHT, AND THIS DEVIATION IS WHAT WE PERCEIVE AS A CHANGE IN APPARENT WEIGHT.

Q: DOES THE CONCEPT OF APPARENT WEIGHT APPLY TO OBJECTS IN THE AIR?

A: YES, IT DOES, ALTHOUGH OFTEN TO A LESSER EXTENT THAN IN LIQUIDS. AIR IS A FLUID, AND OBJECTS MOVING THROUGH IT EXPERIENCE AIR RESISTANCE, WHICH CAN SLIGHTLY ALTER THE FORCES ACTING ON A SUPPORT. IN CERTAIN HIGH-SPEED SCENARIOS OR WITH VERY LIGHT, LARGE OBJECTS, THESE EFFECTS CAN BECOME MORE NOTICEABLE, INFLUENCING APPARENT WEIGHT. HOWEVER, FOR MOST EVERYDAY SITUATIONS ON THE GROUND, THE BUOYANT FORCE OF AIR IS NEGLIGIBLE COMPARED TO OTHER FORCES.
